

Offender Identification System

Fast and Accurate Offender Identification
with Iris Identification Technology

Offender-ID™ Features and Benefits

- Integrated Iris Technology
- Quickly Identify Repeat Offenders
- Remote Identification Using Portable Biometric Devices
- Mug Shot Capability
- Reduces Paper Based Subject Identification
- Decrease Erroneous Releases
- Reliable Audit Trail
- Configurable to Search Multiple County/State Iris Databases

Proper identification is the first and most critical part of offender processing. Offender-ID™ is an advanced inmate identity management system that incorporates advanced iris technology for fast and accurate identification. Critical processes such as booking and release can now be quickly and securely executed preventing inmates from falsifying their identities.

The Offender-ID system can be integrated into an existing JMS/Mug Shot system or other “Systems of Record” or can operate as a standalone biometric and biographic repository. In both the integrated and standalone setup, officers are able to create audit trails of subject enrollments/identifications, query records with text based biographic searches, and generate customizable reports.

Offender-ID Integrated

When integrated, the Offender-ID program interfaces directly with existing systems by linking inmate information (including a mug shot) to an iris record via a unique identifier number and a data bridge between the systems.

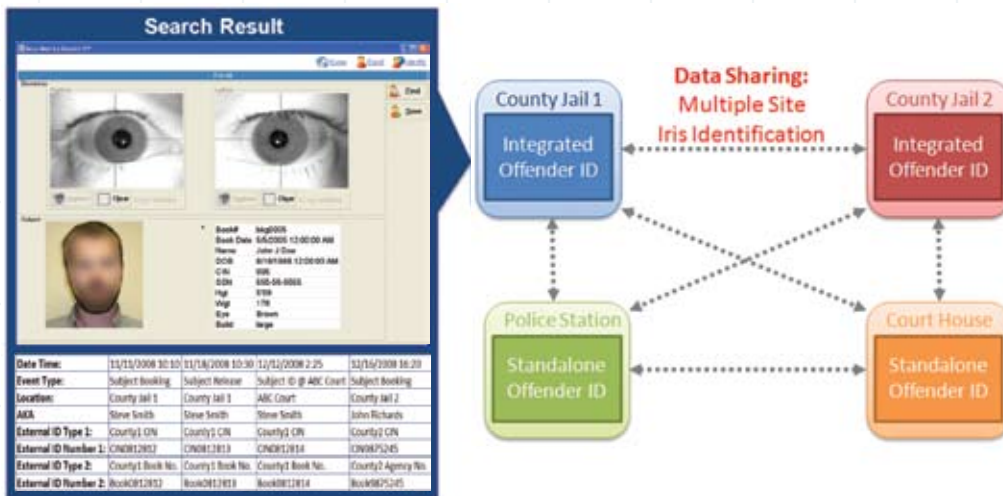

When a subject is identified, an iris match prompts a query of the system of record via the unique identifier number and data bridge in order to pull all relevant inmate information into the Offender-ID application. Any information updated in the system of record is automatically reflected in the Offender-ID system when a subject is identified.

Offender-ID Standalone

When operating as a standalone system, Offender-ID complements your jail management system by adding the value of iris enrollment and identification to your inmate identification process but keeps a separate data repository. This setup enables an officer to capture an inmate’s iris images, a mug shot, and any relevant biographic information for storage in the Offender-ID database. As a stand-alone system, the Offender-ID solution is able to accurately enroll, identify, book, and release inmates, as well as keep an accurate count on all current active inmates in your facilities.

Data Sharing

The Offender-ID system in both integrated and standalone mode effectively utilizes biometric technology and iris identification to provide many benefits to an individual facility or jurisdiction. The ability to quickly and accurately identify repeat offenders at pre-booking or ensuring positive ID at release is a powerful tool by itself. The real power of iris identification is the ability to share data and query multiple jurisdictions' iris and offender in real time. The Offender-ID solution can easily be configured to query an unlimited number of iris data sources and package the results in an easily viewable manner (see the below diagram).

“After exploring various technologies, we selected iris ID and L-1’s solutions as the fastest and most accurate means of insuring the identity of offenders.

Our primary goal is to provide a greater level of public safety to the Monterey County community and to increase efficiency within the facility”

Capt. Ray McLaughlin
 Monterey County Sheriff's Office
 Monterey, CA

In Focus - Iris Identification

Iris recognition is the fastest, most accurate and scalable of all biometric technologies. The iris contains massive amounts of detailed information unique to each individual and useful for identification. The iris is so unique that even identical twins have different irises. Once the iris is completely formed at about 18 months of age, the structure remains unchanged throughout one's lifetime. Iris recognition technology is noninvasive and completely safe.
